1. Requirements Engineering activities and methods

Name the four activities when doing Requirements Engineering and give one example for every activity.

2. Classification of requirements

In general requirements are split into two groups, functional and non-functional requirements. Think about requirements when designing a room planning system where the administration can add/remove rooms, teachers can block rooms if available and students can send queries to check where their lessons will take place.
Name 5 requirements for each group.

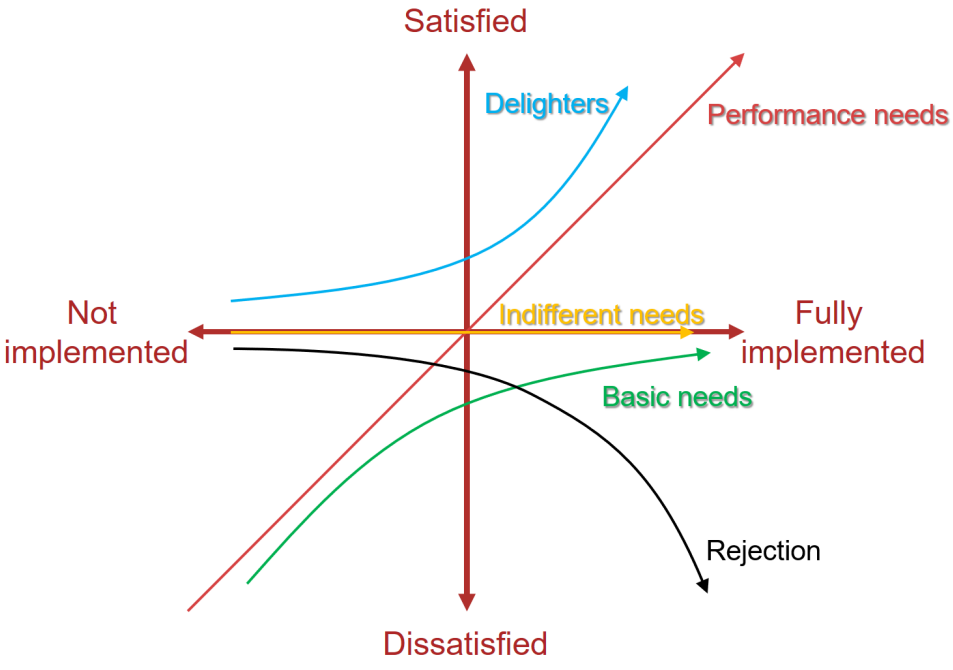

3. Liability of keywords

Requirements should be classified by using special keywords. The most famous keywords used are SHALL, SHOULD and WILL. Name their legal binding.

4. Customer satisfaction (KANO-Model)

There are several methods to classify the liability of requirements. One method is using the KANO-Model to classify requirements depending on their influence on customer satisfaction. According to this model, there are five different “needs”.

- Basic needs
- Performance needs
- Delighter needs
- Indifferent needs
- Rejection needs

Think about designing the room planning system again and name one example for every need.

5. Well formulated requirements

Take two of your examples from “Customer satisfaction (KANO-Model)” and try to formulate them as requirements. Remember, a well formulated requirement should be complete, necessary, atomic, traceable, technically solution-neutral, realizable, consistent, unambiguous and testable.

6. Non-requirements

The Musterstadt Education Centre is having a vocabulary trainer app developed for its language courses. Participants are encouraged to practise their vocabulary between course sessions.

List five requirements that are not specified, and explain why it would be necessary to separate the project from them.

7. Requirement sources

A local authority is planning to set up a digital citizens’ service centre. Citizens will be able to book appointments online, register or change their address, and apply for documents such as identity cards or certificates of residence.

What specific sources come to mind, that would be relevant?

What requirements might arise from these sources, and what might be a source that could easily be overlooked?

The second half of the exercise is carried out live.
